Introduction TU Delft - Enatom
OCTOBER 2023

explicit content

INTRODUCTION

THE PROBLEM: Whilst the need for anatomical knowledge increases, the gap between theory and practice in anatomy education is too big due to

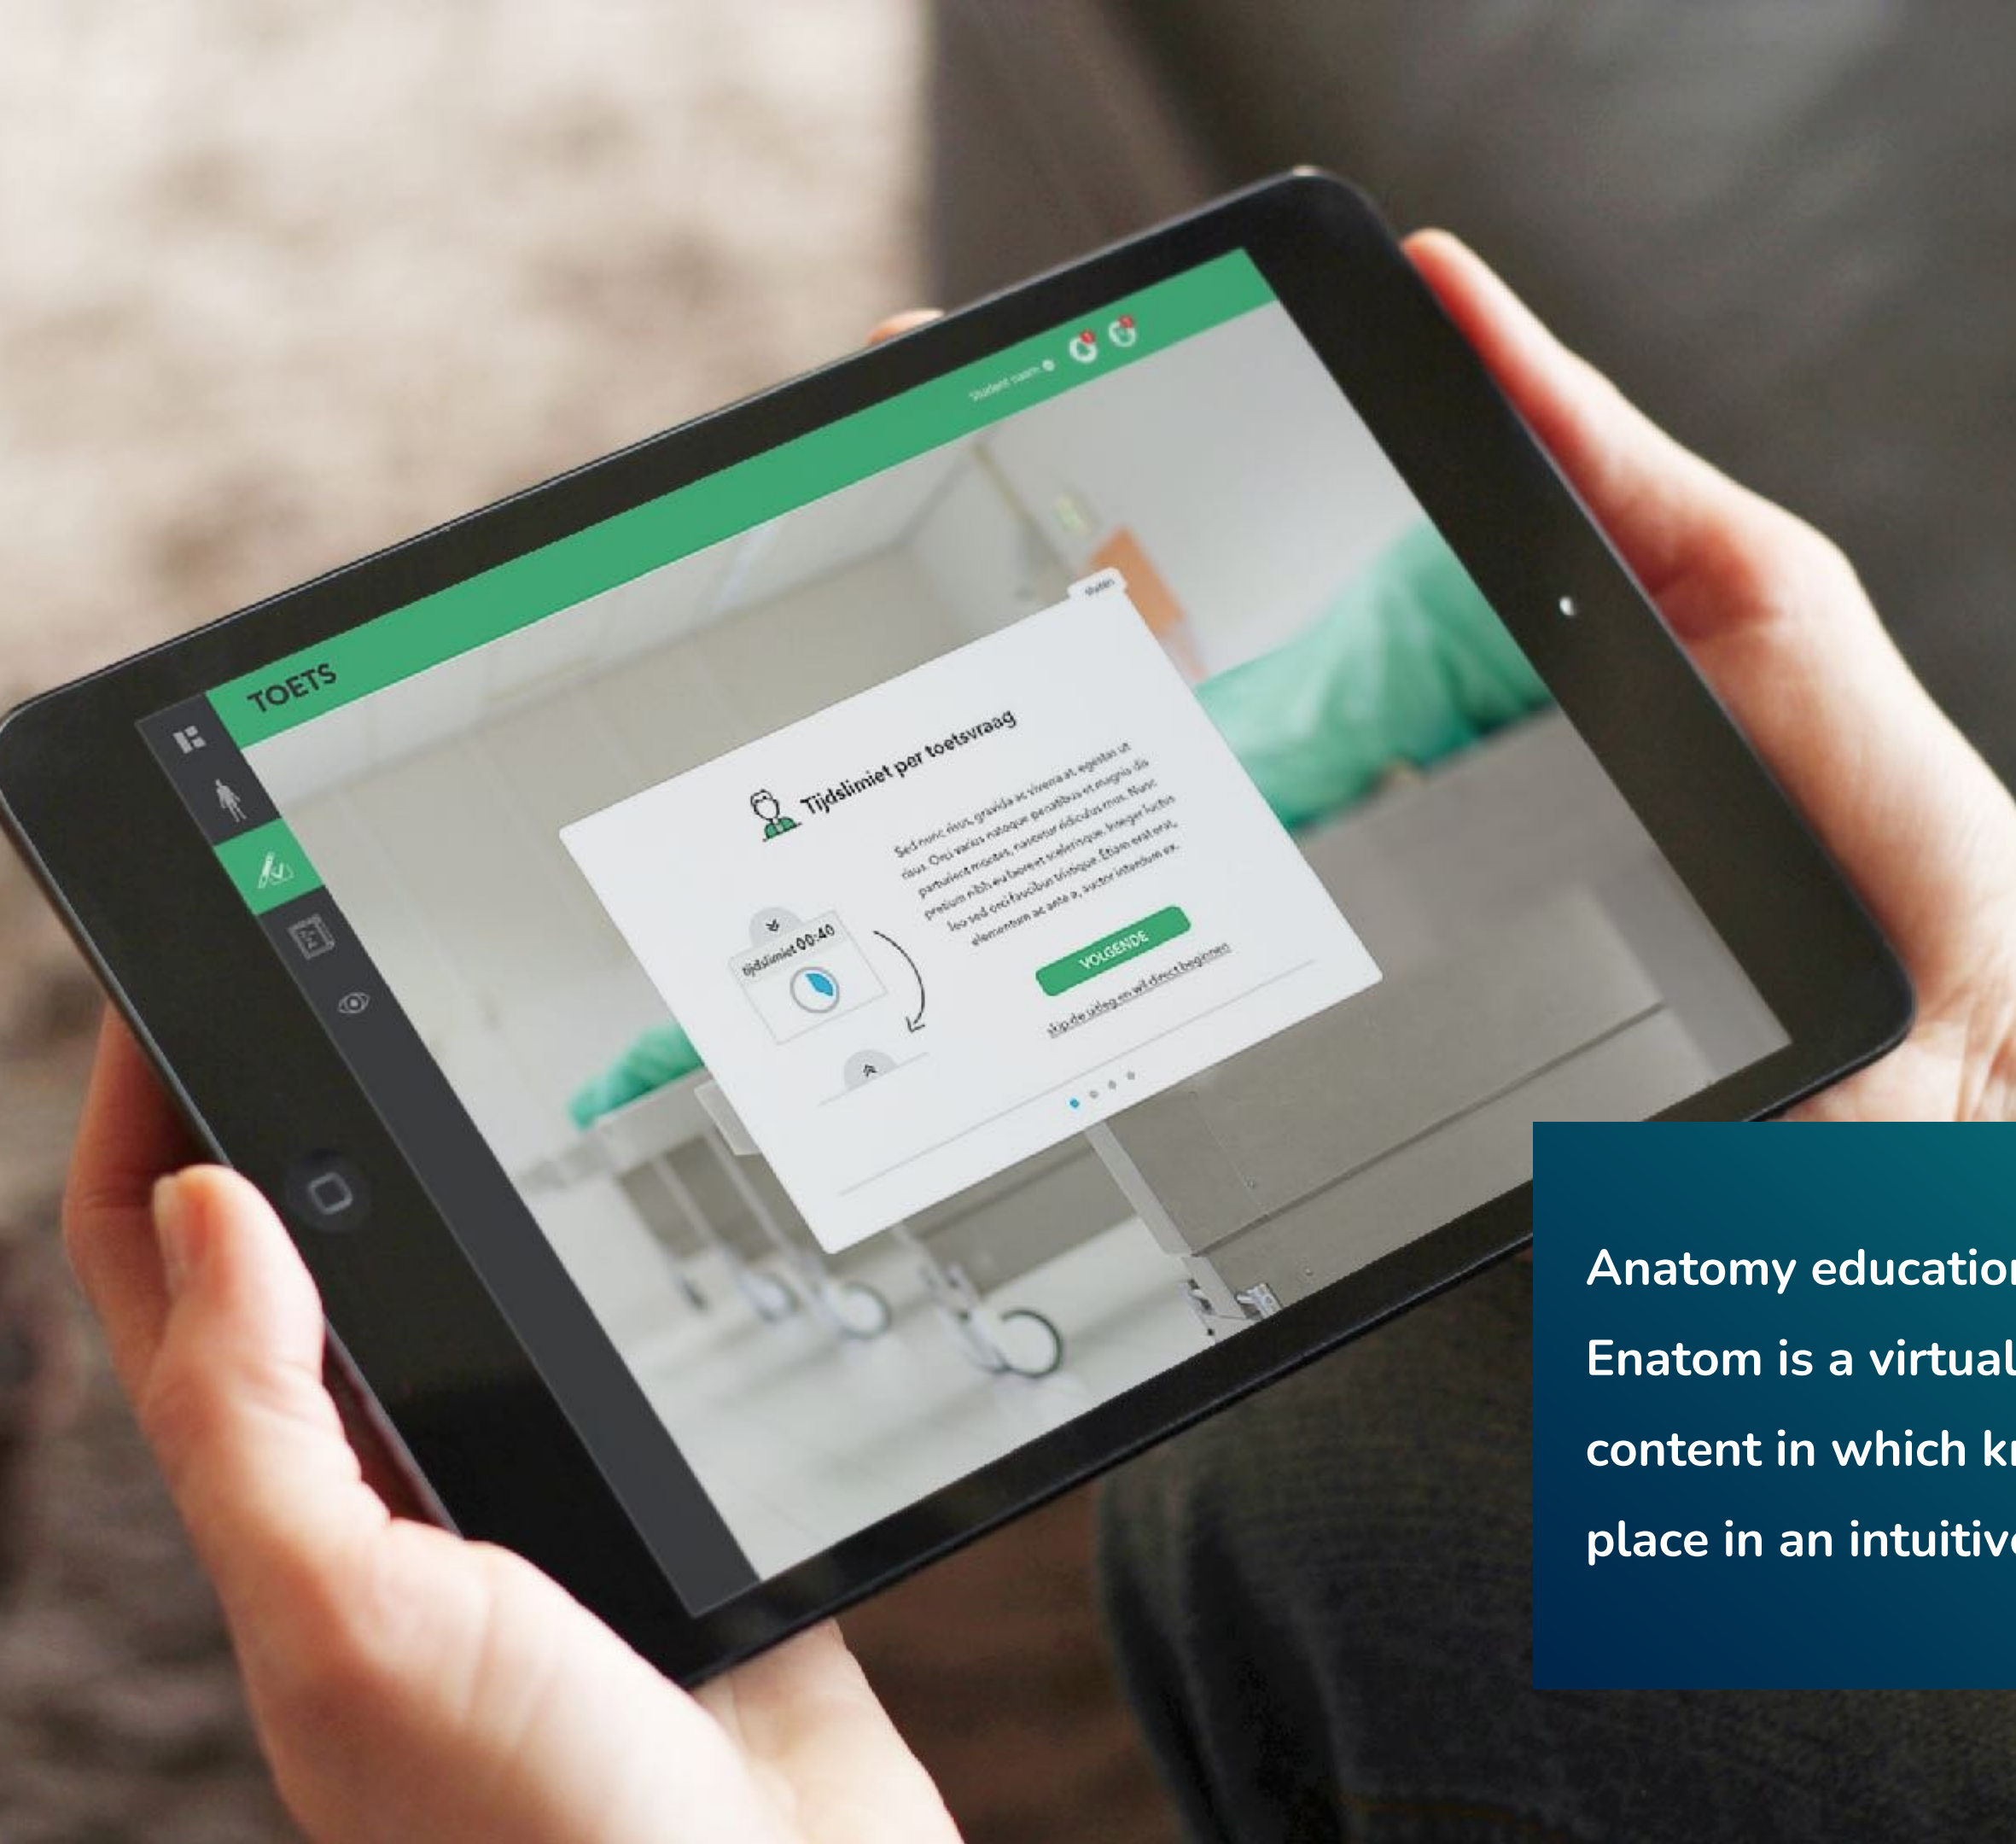

1. Limited/no access to dissection rooms, because of:

- Cultural beliefs (e.g. religion does not allow dissection)
- Low resource settings
- Deliberate choice
 - Cost effectiveness
 - New institutes
 - Limiting use of biocides

2. The changing educational landscape in biomedical studies:

- Students are expected to do more self study when it comes to basic/exact knowledge like anatomy.
- Contact hours are decreasing
- Exponential growth of available anatomical information - how to extract the right knowledge?
- New studies - where students enroll with different study/job backgrounds (lack of basic level of anatomy)

OUR SOLUTION

*A photorealistic
Digital twin*

Anatomy education for tomorrow's healthcare professional. Enatom is a virtual dissection room with photorealistic content in which knowledge transfer and testing can take place in an intuitive way at any place and any time.

Torso 6

4

A virtual dissection room built on (digital) craftsmanship

Photo realistic and
diverse content

Web application -
Anatomical Atlas

Assesment

Ready for future use

Challenges

- continuous level of detail delivery
- Future proof? (nanotech/nanite/NERF)

- Empty space
 - dynamic point size (splatting, interpolation etc.)
 - point SDF (signed distance field)
 - keep the data as 'real' as possible! (Clinical precision)
- Faster streaming
- Smarter points/nodes selection (see video)
 - Download/stream order
 - Frustum culling
- Memory handling (MAC!) gpu/cpu
 - platform agnostic

Geomatics?

It's the same! but different

- Showing AS IS data
- Importance of details

- Explorative vs knowledge building
- Direct use vs clinical and photoreal details

- Areas of interest
- Data usage

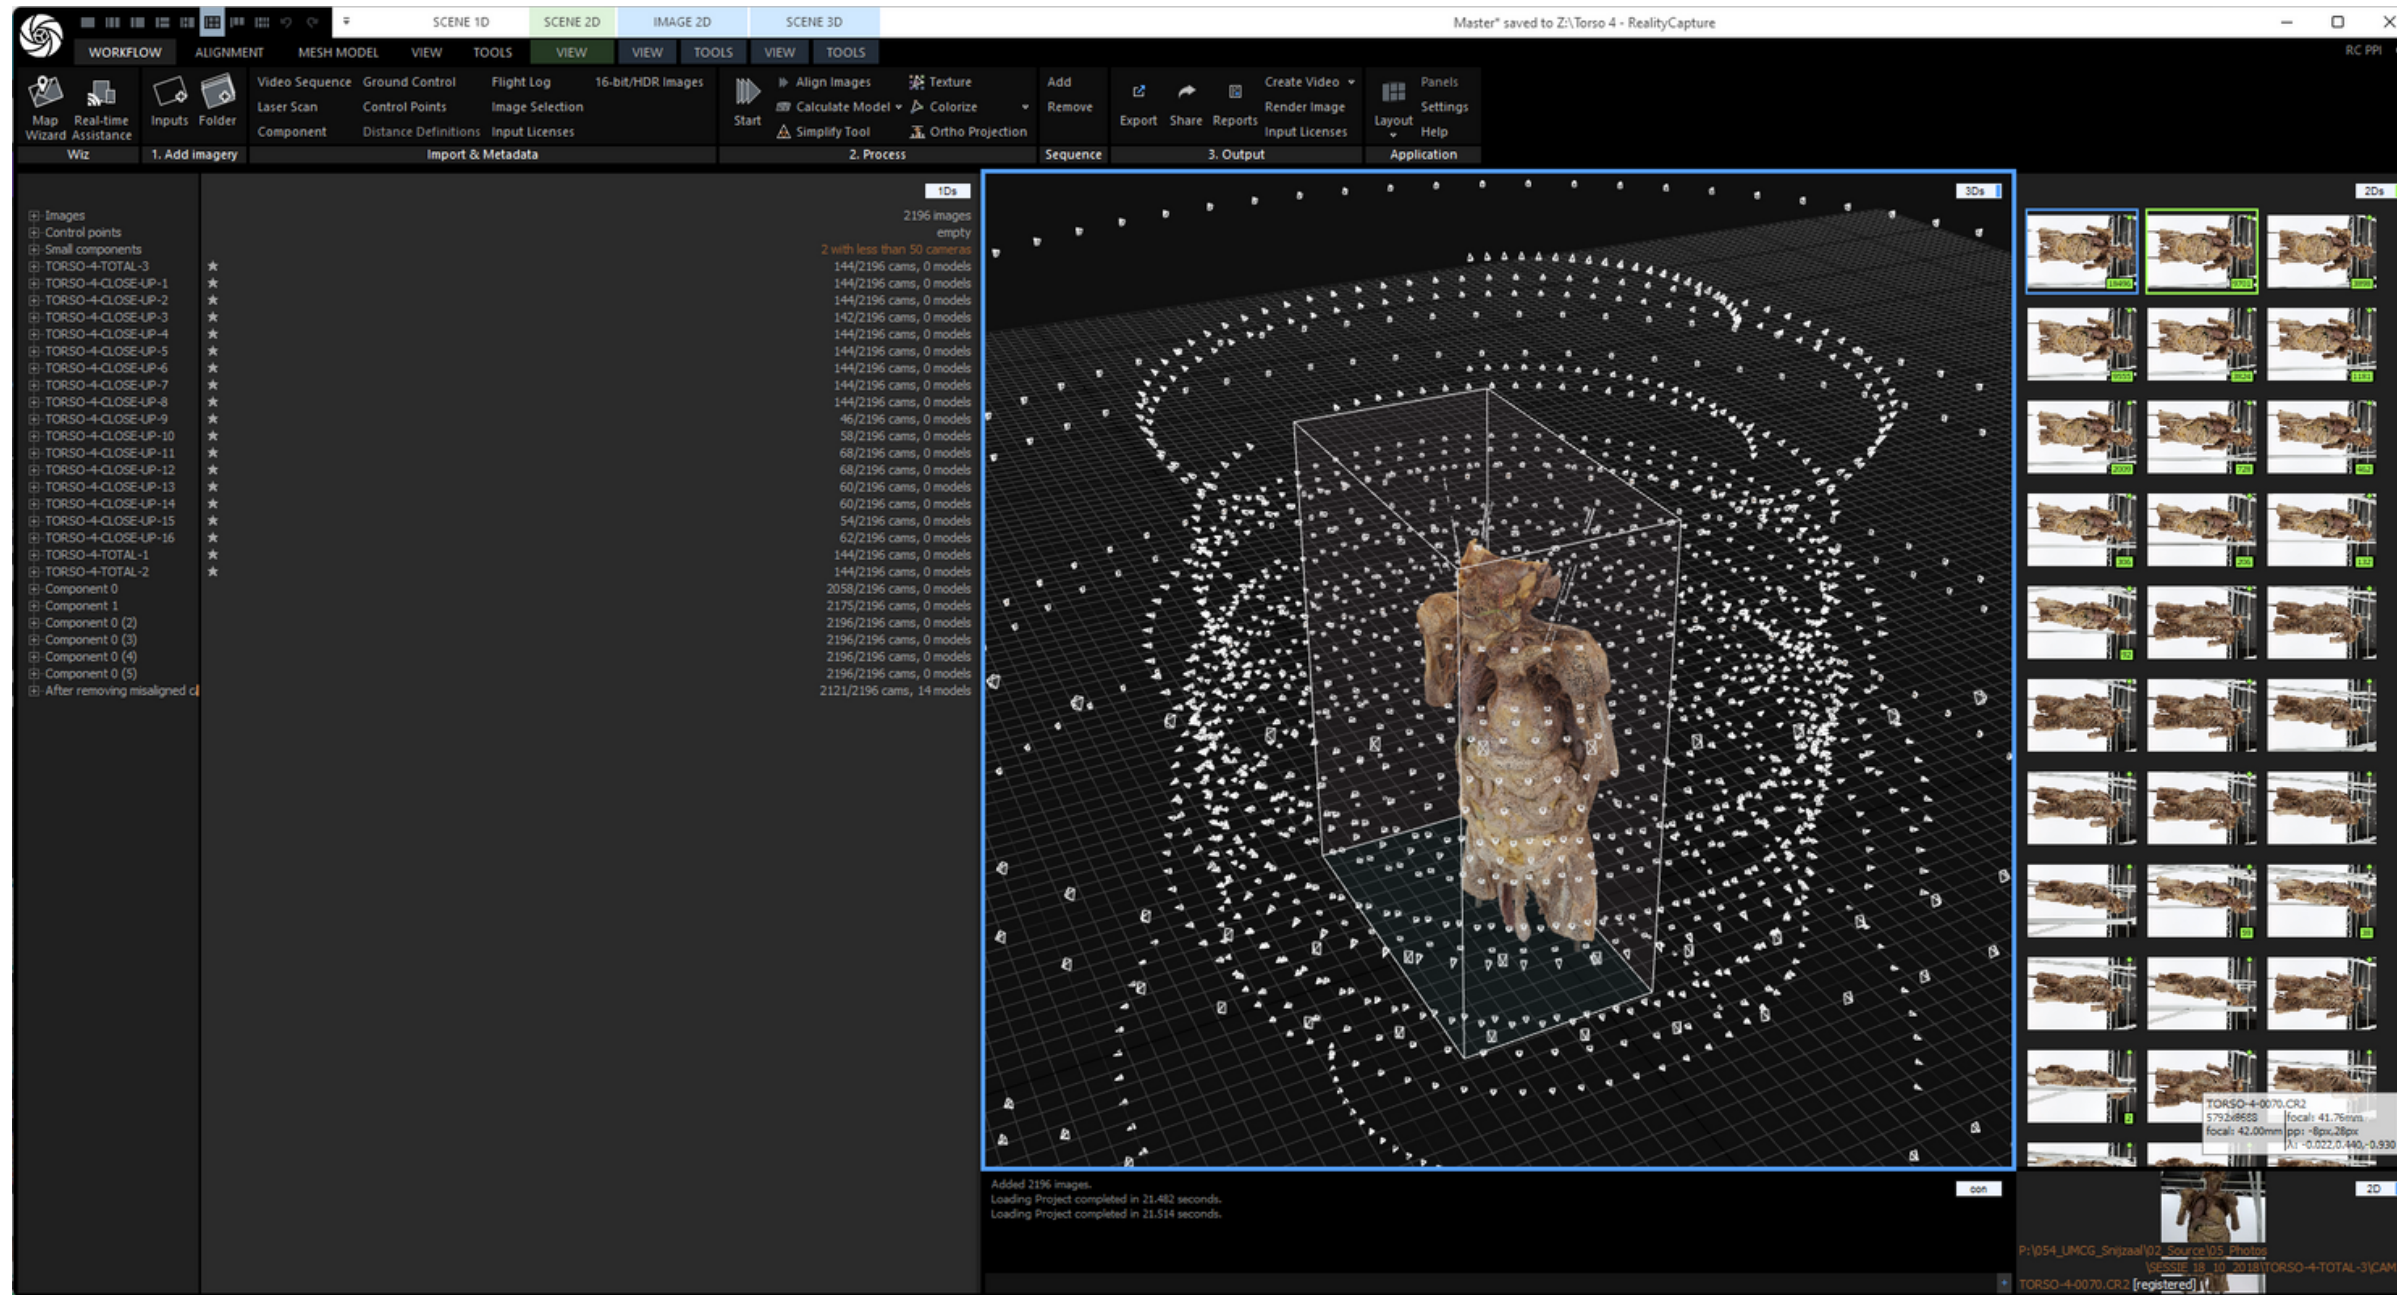

Our process

Preparing and photos

Our process

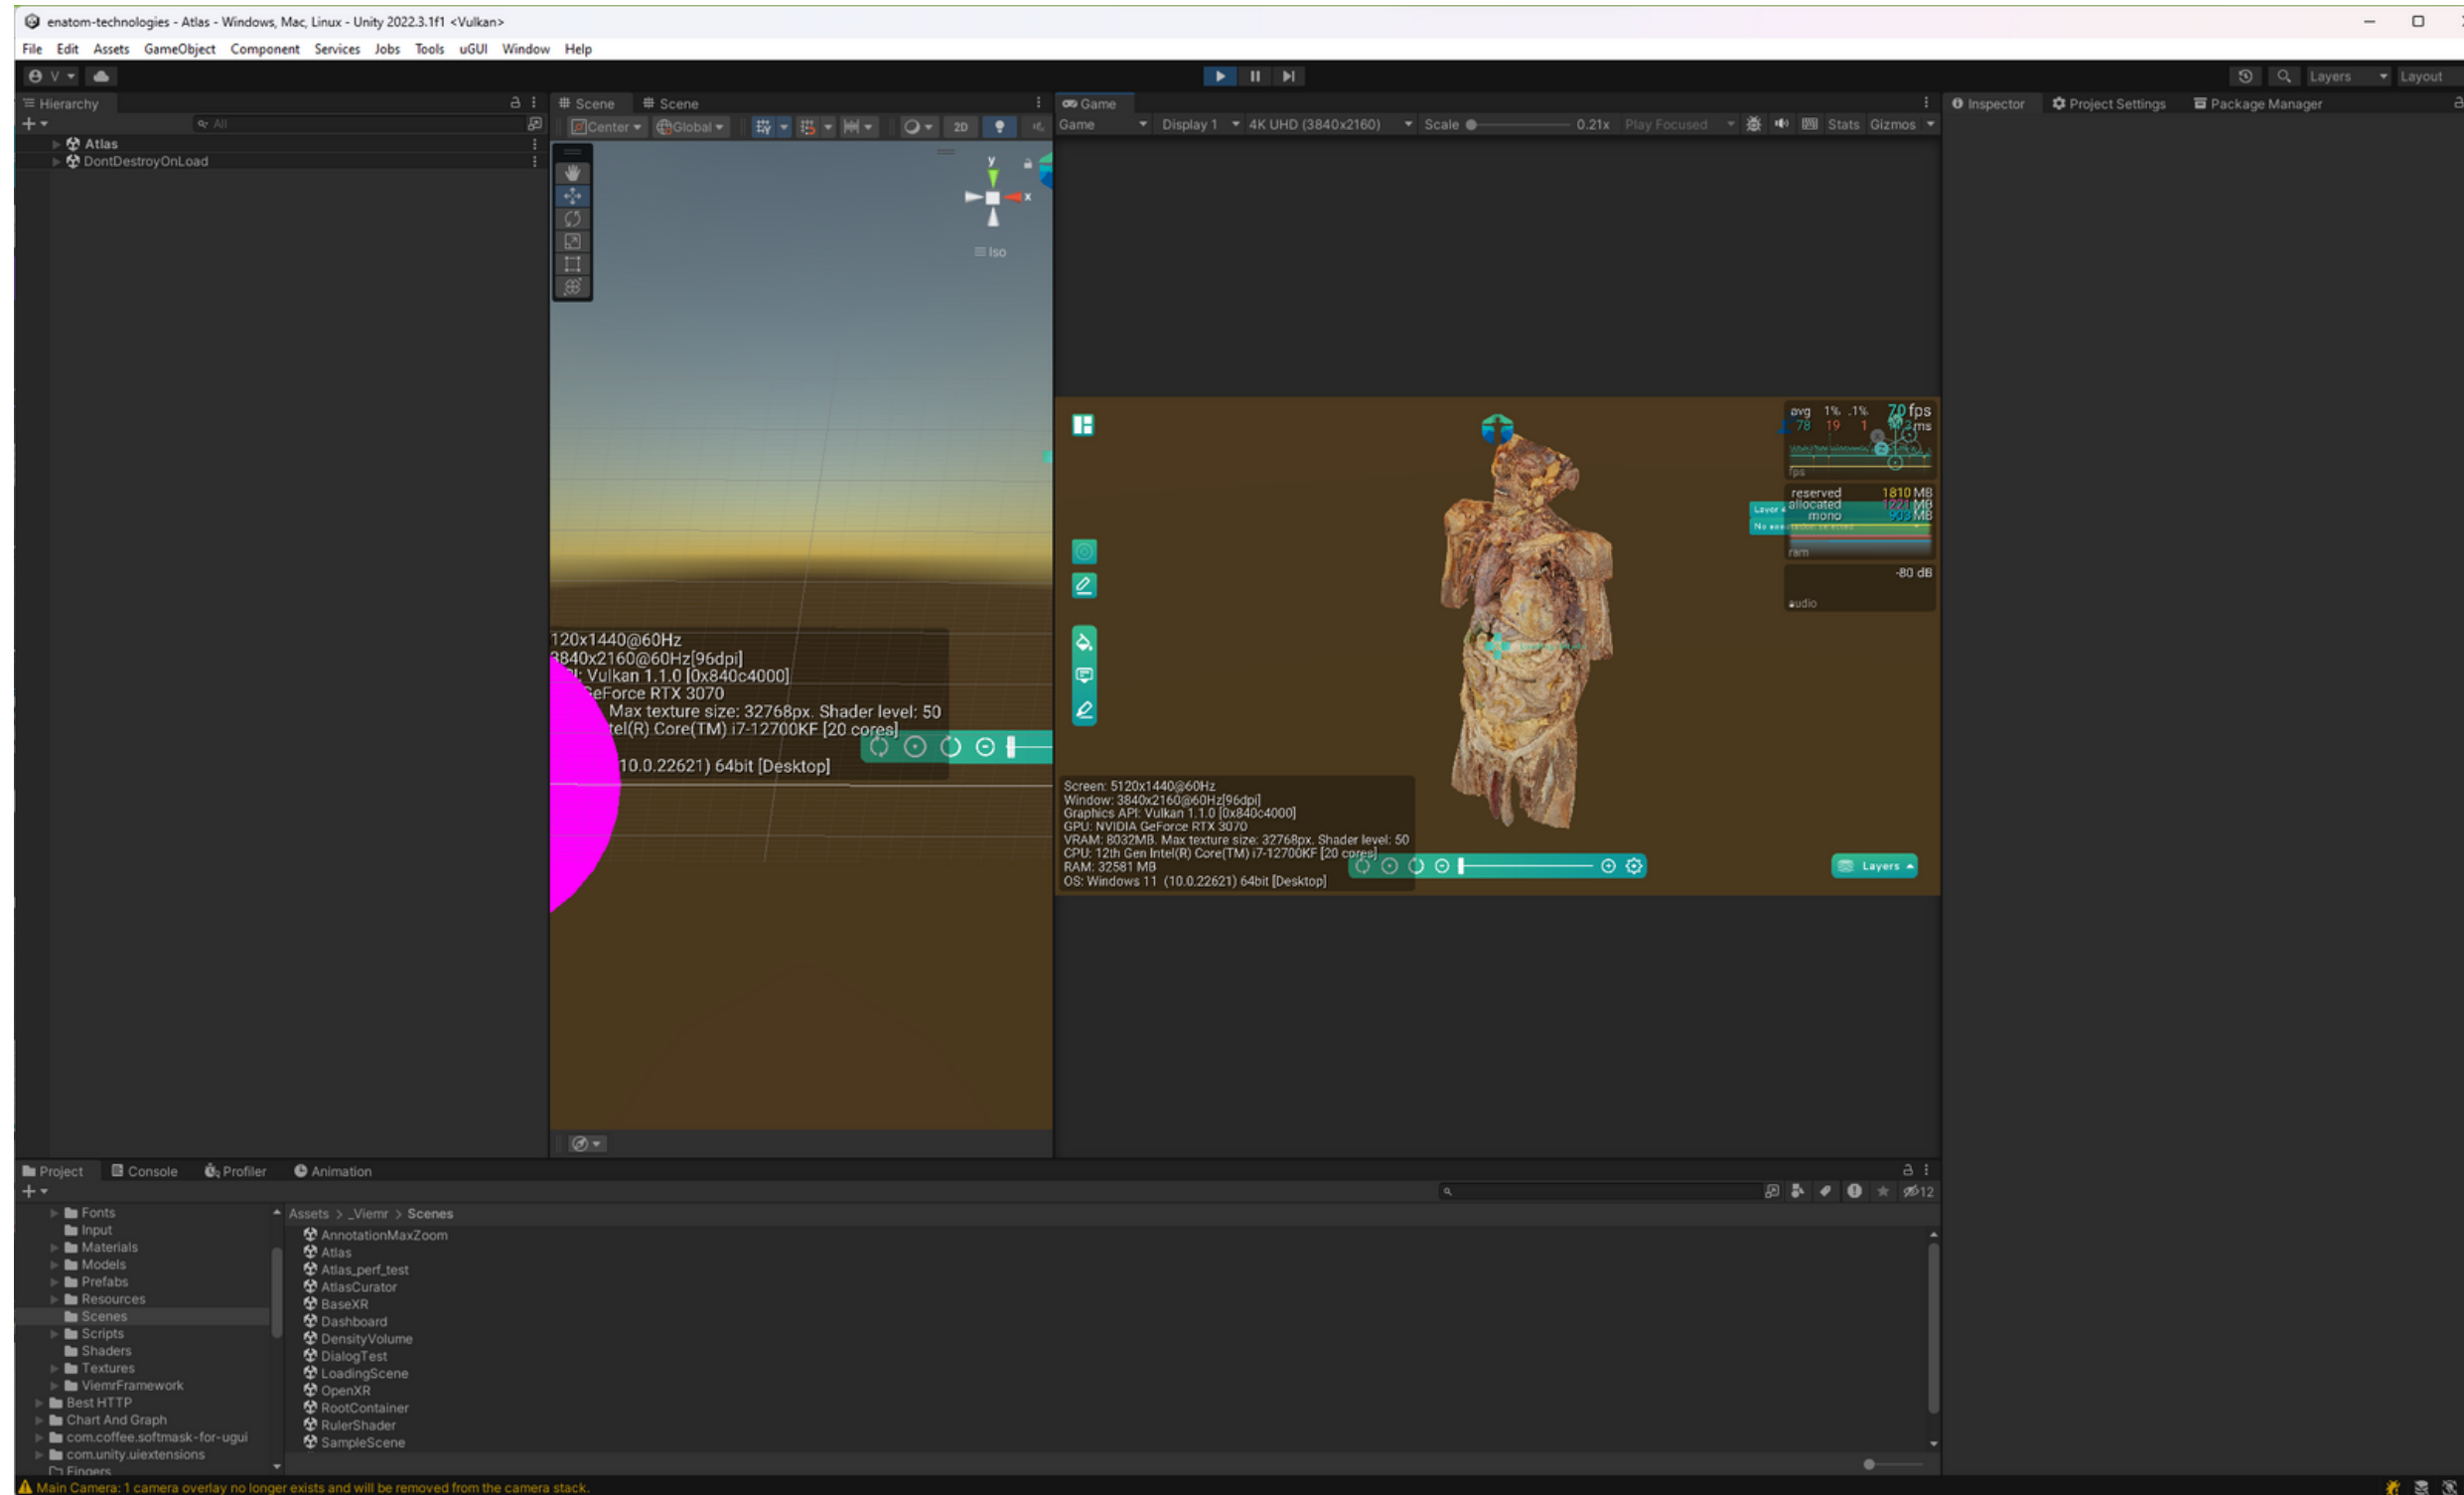

Reality capture

Our process

Arena 4D annotation

Our process

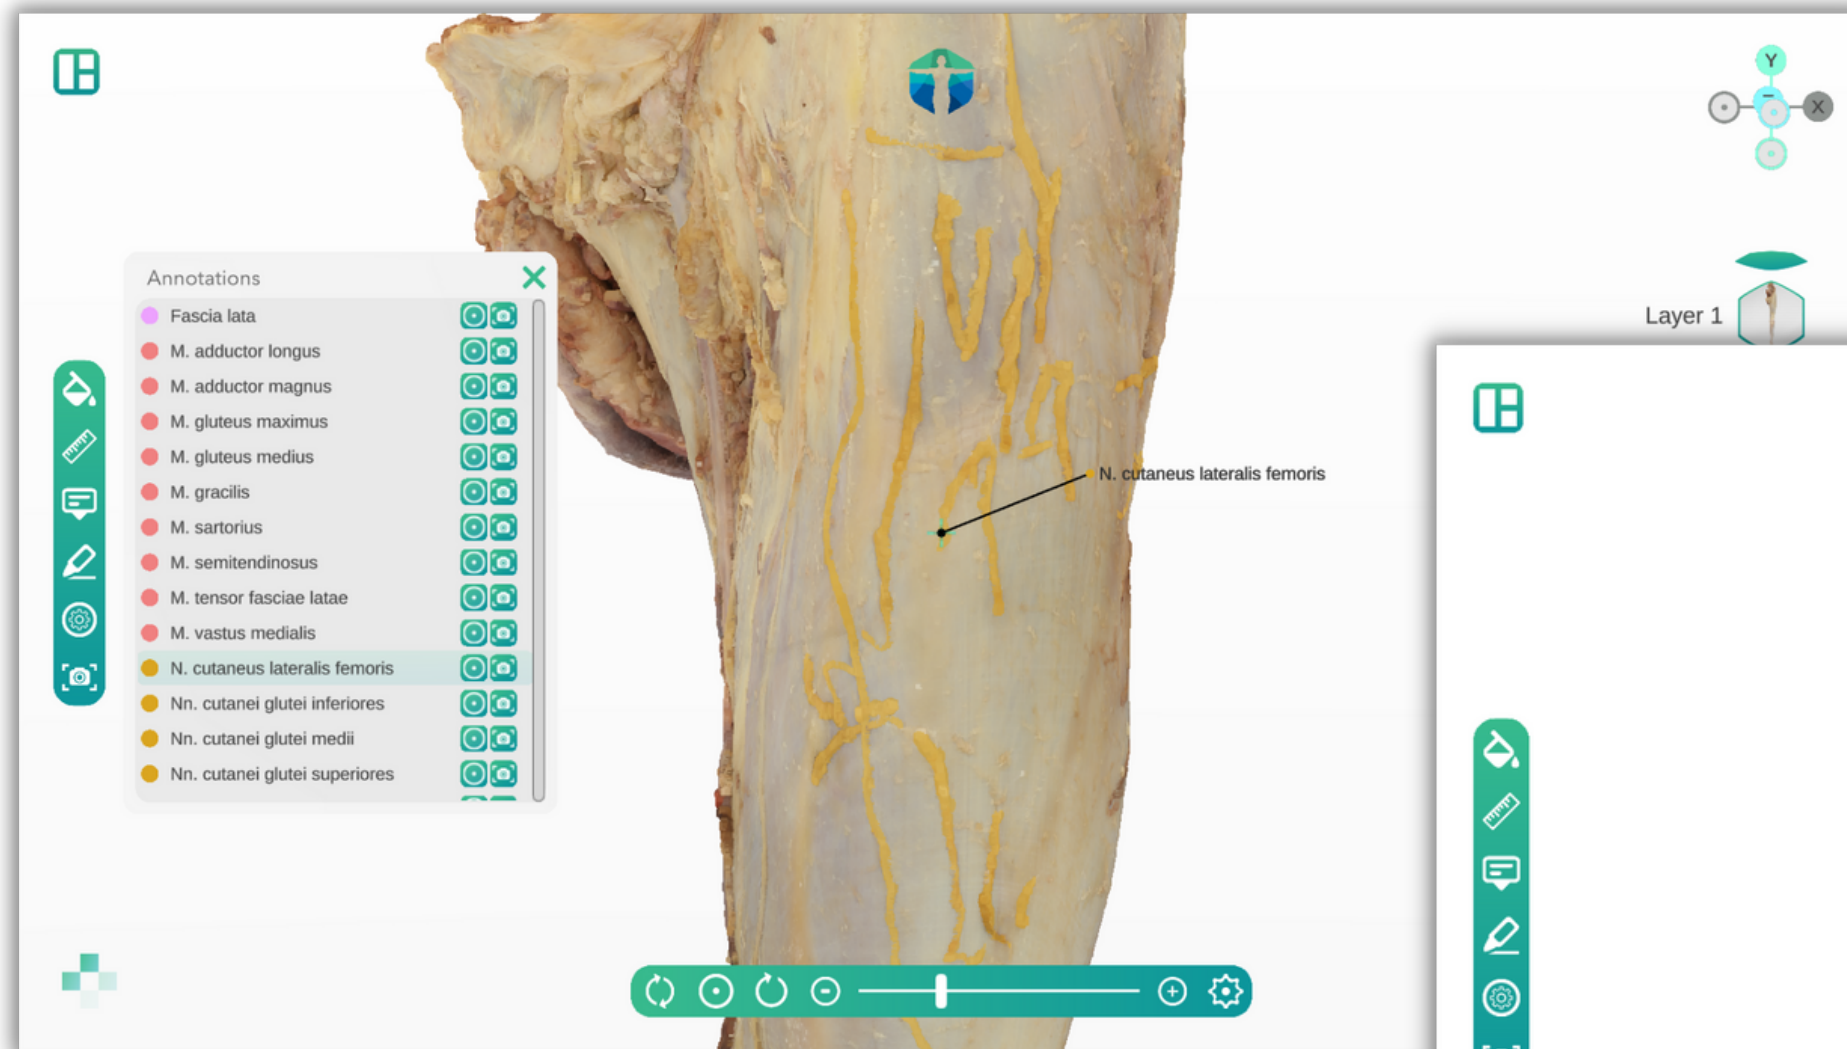

Unity engine

SPECIMEN - 6 LAYERS OF CONTENT

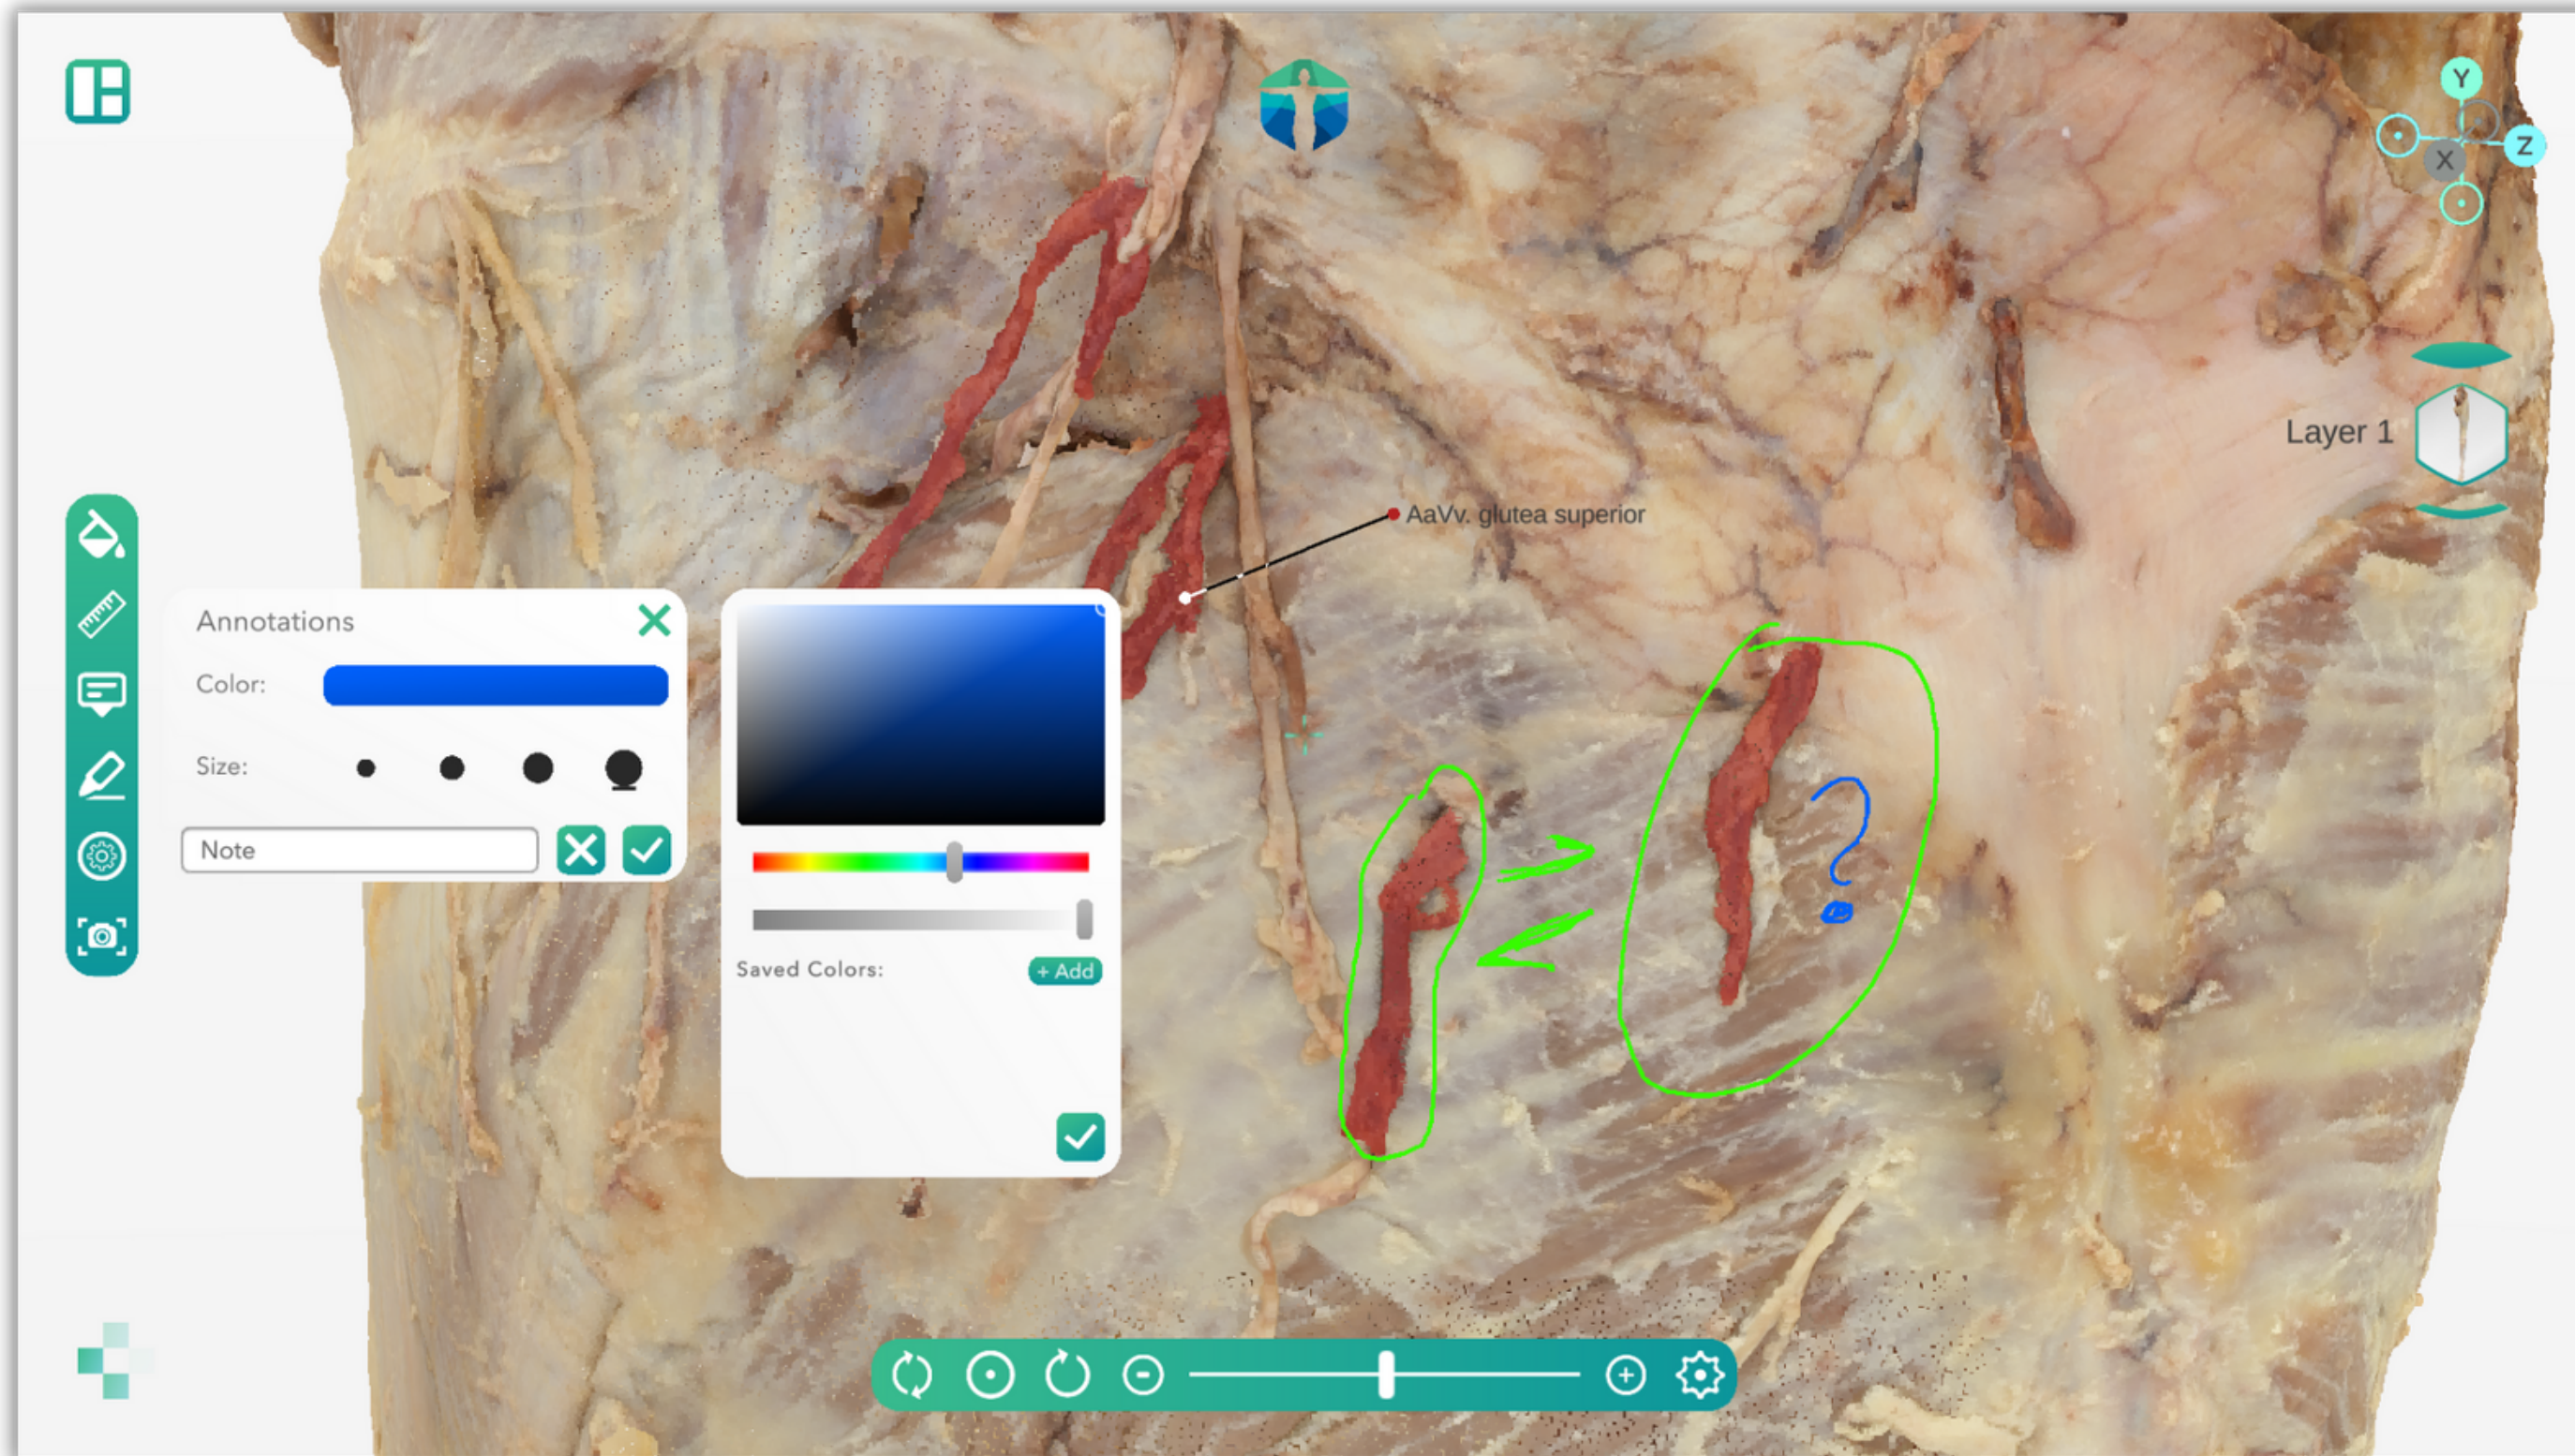

- 200 million plus points per specimen
- Using Potree v.1.7 format (octree nodes)
- Encrypting and decrypting binary files while streaming
- Flattening the potree structure for speed
- Using Intensity as 'classification' system
- Changing colour for selecting structures/annotations
